

Product Care & Instructions for Phone-, VHF-Cases, small & large Multi-Purpose Cases

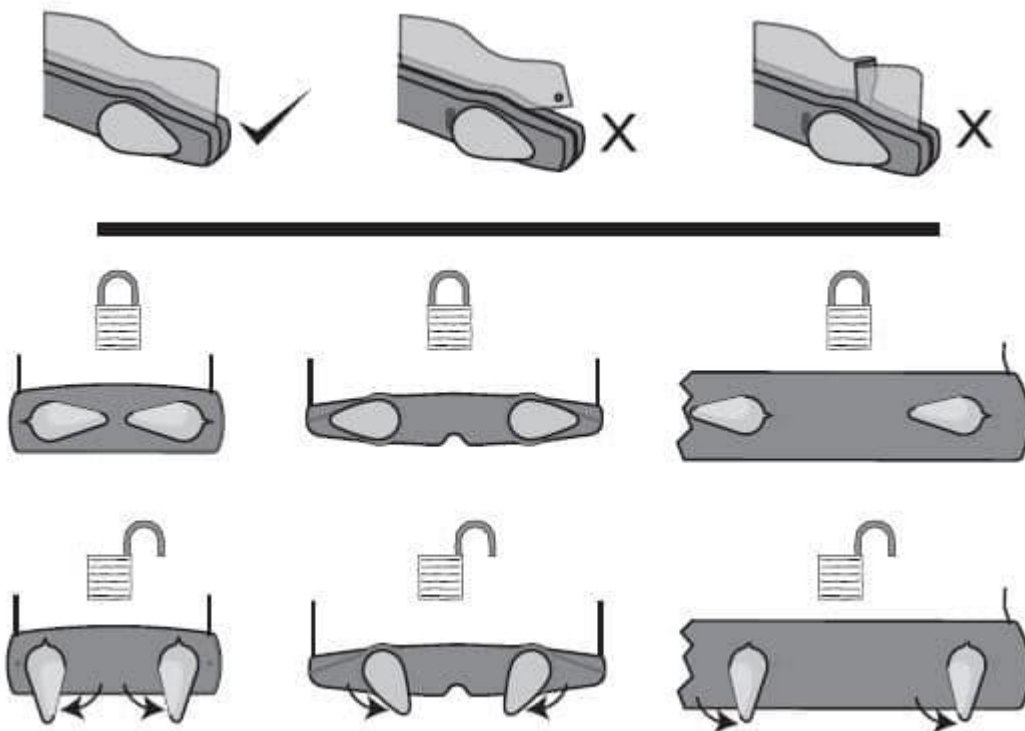

Instructions for TPU cases with 85 mm up to 350mm Aquaclips

Warning: The warranty of Aquapac covers this Aquapac only, and not any items you may put inside it. We recommend that you insure the contents separately.

Waterproofness: Our range has been independently tested to international waterproofing standards. However, the waterproofness of your Aquapac depends on your closing and opening it carefully, and on it not being damaged either before or during use. Please follow all instructions carefully.

Before Every Use: Seal something worthless inside, then submerge in a basin to check the waterproofness. If there is water in the case, please do not use the case.

How to open and close different clamp sizes:

Closing the Case: Make sure that all parts are properly attached. Wipe away any grit or sand, which could hamper the seal. Always turn all levers as far as they will go. They should lock smoothly, if not there may be something impeding the seal.

Opening the Case: Never open your Aquapac in or under water. In order to stop any water getting in when you are opening it, first shake off any water then dry with a towel. Hold the case with the opening at the bottom as you open it.

Ongoing Care: Our materials are strong but can still be punctured. Avoid sharp or abrasive objects and protect from impacts. After regular contact with chlorinated or salt water, or with sun creams, wash in soapy water and then rinse with fresh water. Do not use bleach, alcohol or proprietary cleaners.

Materials: Aquapacs are made from a variety of materials, mostly plastics which make them rustproof. These include TPU, ABS, nylon and polypropylene.

Extreme Temperatures: Although the case material has been UV-stabilized – which means that the plastic shouldn't be discoloured or broken down by sunlight – the Aquapac won't protect anything inside it from heat or sunlight. The soft case material is functional and flexible in air temperatures -40°C to +60°C (-40°F to +140°F), and water temperatures up to +40°C (+100°F).

Humidity and Condensation: In humid climates there will be moisture in the air sealed inside the case. Desiccant sachets will absorb the moisture, keeping the contents completely dry. We recommend use of desiccant sachets in all Aquapacs in humid climates. You can purchase spare sachets – see Accessories.

Warning: This is not a toy. It may contain small parts which may be a choking hazard to children under 3. Keep small parts away from children.

Tips for Taking Good Photographs: If you follow a few guidelines there's no reason why anyone should notice that your photos were taken through a case. It's a bit like taking a photograph through your window at home. First of all the window needs to be as clean as possible. Even with a clean window you may notice some reflection, but the closer you hold the camera lens to the window, the less the reflection. Similarly our cases give best results with the lens window tight against the camera lens. Try to avoid flash photography but if you do need to use the flash, make sure that the case is tight over the flash so the light doesn't reflect back into the lens.

Underwater Photography: It takes a bit of practice – and a little luck – to get really good underwater photos. Please don't think that every shot you take is going to make the cover of SportDiver magazine! You need strong sunshine and clear water. The middle of the day is best, when the sun's at its highest. Best results will be just below the surface. Light disappears quickly as you go deeper, as do colours (one of the advantages of digital cameras is that you can retouch your photos afterwards to replace colours lost underwater). Flash rarely works underwater. Not because of the Aquapac, but because the flash tends to reflect off particles in the water itself. Even clean water is full of micro-organisms and other particles. The less water between you and your subject, the less difference this will make and therefore the clearer your shots are likely to be. Wide lens and close up is the secret.

Instruction for Stormproof cases (f.e. Noatek, VHF-Case)

Warning: Our warranty covers this Aquapac only, and not any items you may put inside it. We recommend that you insure the contents separately.

Waterproofness: The waterproofness of your Aquapac depends on your closing and opening it carefully, and on it not being damaged either before or during use. Please follow all instructions carefully.

To Seal: Roll down at least 3 times and then secure the buckle.

Care Instructions: Our materials are strong but can still be punctured. Avoid sharp or abrasive objects and protect from impacts. Consider carrying Puncture Patches (art.-no.: 900 in our Shop) in your bag, to repair any damage. After regular contact with chlorinated or salt water, or with sun creams, wash in soapy water and then rinse with fresh water. Do not use bleach, alcohol or proprietary cleaners.

Materials: This cases are made from PU-coated ripstop nylon.

Warning This is not a toy. It may contain small parts which may be a choking hazard to children under 3. Keep small parts away from children.

Instructions for Vinyl Bags with 3-Roll Seal

Waterproofness: The waterproofness of your Aquapac depends on your closing and opening it carefully, and on it not being damaged either before or during use. Please follow all instructions carefully.

To Seal: Roll down at least 3 times and then secure the buckle.

Care Instructions: Our materials are strong but can still be punctured. Avoid sharp or abrasive objects and protect from impacts. Consider carrying Puncture Patches (Art.-No.: 901 in our Shop) in your bag, to repair any damage. After regular contact with chlorinated or salt water, or with sun creams, wash in soapy water and then rinse with fresh water. Do not use bleach, alcohol or proprietary cleaners.

Materials: This cases are made from 500D-Vinyl.

Warning: This is not a toy. It may contain small parts which may be a choking hazard to children under 3. Keep small parts away from children.
